or the enantiomers or diastereomers, salts or esters thereof, and  
b) an agronomically acceptable carrier.

30 In spite of the commercial insecticides, acaricides and nematocides available today, damage to crops, both growing and harvested, caused by insects and nematodes still occurs. Therefor, there is continuing need to develop new and more effective insecticidal, acaricidal and nematocidal agents.

35

It was therefore an object of the present invention to provide new pesticidal compositions, new compounds and new methods for the control of insects, arachnids or nematodes and of protecting growing plants from attack or infestation by insects, arachnids

40 or nematodes.

We have found that these objects are achieved by the compositions and the compounds of formula I. Furthermore, we have found processes for preparing the compounds of formula I.

45

Some compounds of formula I have been described inter alia in US 3,351,599 and Pharm. Ind. 32, p. 923-935 (1970). However, an insecticidal, acaricidal or nematocidal activity of compounds of formula I has not been known yet.

5

The present invention provides a method for the control of insects, arachnids or nematodes by contacting an insect, arachnid or nematode or their food supply, habitat or breeding grounds with a pesticidally effective amount of compounds of formula I.

10

Moreover, the present invention also relates to a method of protecting growing plants from attack or infestation by insects, arachnids or nematodes by applying to the foliage of the plants, or to the soil or water in which they are growing, a pesticidally

15 effective amount of compounds of formula I.

Depending on the substitution pattern, the compounds of formula I can contain one or more chiral centers, in which case they are present as enantiomer or diastereomer mixtures. Subject-matter of  
20 this invention are not only compositions containing these mixtures but also those containing the pure enantiomers or diastereomers.

The compounds useful in the present invention may be readily synthesized using techniques generally known by synthetic organic chemists. Exemplary synthesis methods are taught in US 3,351,599, which is incorporated by reference.

Compounds of formula I wherein X is oxygen are for example obtainable according to the procedure described in Chem. Pharm. Bull.  
30 23, pp 2223-2231 (1975).

Compounds of formula I wherein X is methylene are for example obtainable according to the procedure described in US 3,496,182.

35

Compounds of formula I wherein X is  $\text{NR}^a$  are for example obtainable following the procedures described in J. Med. Chem. 14, p. 56-58 (1971), and J. Med. Chem. 13, p. 979-981 (1970).

sulfur or C<sub>1</sub>-C<sub>6</sub>-alkyl linkage, or C<sub>5</sub>-C<sub>8</sub>-cycloalkenyl, wherein the carbon atoms in these aliphatic groups can be substituted by 1 to 4 groups selected from halogen, cyano, hydroxy and nitro, o is 1 or 2, and the further variables and the indices are as defined  
5 for formula I are preferably obtainable by a five step reaction,

wherein in a first step benzoic acid derivatives of formula II are reacted with thiophenol derivatives III in the presence of a base  
15 to give compounds IV, wherein the variables and the indices of the compounds II, III and IV have the meanings as defined for formula I.

The reaction is usually carried out at temperatures of from -70°C to 250°C, preferably from 25°C to 150°C, in an inert organic solvent such as toluene or water in the presence of a base such as  
25 alkali metal and alkaline earth metal hydroxides, for example lithium hydroxide, sodium hydroxide, potassium hydroxide, calcium hydroxide, and potassium carbonate, and preferably a transition metal halogenid such as CuCl, CuBr or CuI as a catalyst [lit. Houben-Weyl, Methoden der organischen Synthese, 4<sup>th</sup> edition, Bd.  
30 9, p. 112-113, Georg Thieme Verlag Stuttgart].

Compounds of formula II are obtainable by customary methods, or are commercially available [see e.g. J. March, Advanced Organic  
35 Chemistry, 4<sup>th</sup> edition, chapters 11, 13, 14, and 15, John Wiley & Sons New York].

Compounds of formula III are commercially available.

40 In a second step, compounds of formula IV are transformed into compounds of formula V, wherein the variables and the indices have the meanings as defined for formula I, by cyclization with polyphosphoric acid [lit.: US 3,351,599; Houben-Weyl, Methoden der organischen Synthese, 4<sup>th</sup> edition, Bd. 7/2a, p. 15-22, Georg  
45 Thieme Verlag Stuttgart].

The reaction can optionally be carried out as a two-step process, preferably without isolation of the intermediates. Here, the car-

## 6

bon acid function of compounds IV first is activated, such as by converting carboxylic acids of formula V into their corresponding carboxylic acid halides, e.g. with chlorinating agent such as  $\text{SOCl}_2$ ,  $\text{POCl}_3$ ,  $\text{PCl}_5$ , or  $(\text{COCl})_2$  [lit.: J. March, Advanced Organic

5 Chemistry: reactions, mechanisms and structure, 4th ed. 1992, Wiley&Sons, New York]. The thiepine ring then is formed via a Friedl-Crafts acylation with a Lewis acid such as  $\text{AlCl}_3$ ,  $\text{AlBr}_3$ ,  $\text{FeCl}_3$ ,  $\text{ZnCl}_2$ ,  $\text{SnCl}_4$ , or  $\text{TiCl}_4$ .

15 The reaction is usually carried out at temperatures of from  $-70^\circ\text{C}$  to  $250^\circ\text{C}$ , preferably from  $0^\circ\text{C}$  to  $100^\circ\text{C}$ , in an inert organic solvent [lit.: Houben-Weyl, Methoden der organischen Synthese, 4th edition, Bd. 7/2a, p. 15-22, Georg Thieme Verlag Stuttgart].

20 In a third step, compounds of formula V are hydrogenated to give compounds of formula VI, wherein the variables and the indices have the meanings as defined for formula I, and the hydrogenating agent for example is a metal hydride or metal boron hydride such as  $\text{NaBH}_4$  or  $\text{LiAlH}_4$ .

30 The reaction is usually carried out at temperatures of from  $-70^\circ\text{C}$  to  $250^\circ\text{C}$ , preferably from  $0^\circ\text{C}$  to  $100^\circ\text{C}$ , in an inert organic solvent such as alcohols, for example ethanol [lit.: US 3,351,599].

In a forth step, compounds of formula VI are halogenated to give  
 35 compounds of formula VII, wherein the variables and the indices have the meanings as defined for formula I. The halogenating agent may be a chlorinating agent such as  $\text{SOCl}_2$  or a brominating agent such as  $\text{HBr}$ .

7

The reaction is usually carried out at temperatures of from  $-70^{\circ}\text{C}$  to  $250^{\circ}\text{C}$ , preferably from  $-10^{\circ}\text{C}$  to  $100^{\circ}\text{C}$ , in an inert organic solvent, optionally in the pure chlorinating agent ( $\text{SOCl}_2$ ) [lit.: US 3,351,599].

5

In a last step, compounds of formula VII are reacted with piperazine derivatives VIII, wherein  $o$  and  $R^z$  are as defined for formula I-2A, to give compounds I-2A.

15

The reaction is usually carried out at temperatures of from  $-70^{\circ}\text{C}$  to  $250^{\circ}\text{C}$ , preferably from  $0^{\circ}\text{C}$  to  $200^{\circ}\text{C}$ , in an inert organic solvent or pure compound VIII [lit. US 3,351,599].

20 Compounds of formula VIII are commercially available or can be prepared following methods described in the literature [see e.g. J. Org. Chem. 31, p. 3867-3868 (1966)].

30 Compounds of formula I-2B wherein the variables and the indices have the meanings as defined for formula I-2A can be prepared by reacting compounds of formula V with piperazines VIII in the presence of an inert organic solvent and a Lewis acid such as  $\text{AlCl}_3$ ,  $\text{FeCl}_3$ ,  $\text{ZnCl}_2$ ,  $\text{SnCl}_4$ , or  $\text{TiCl}_4$ .

35

The reaction is usually carried out at temperatures of from  $-70^{\circ}\text{C}$  to  $250^{\circ}\text{C}$ , preferably from  $-10^{\circ}\text{C}$  to  $150^{\circ}\text{C}$ , in an inert organic solvent in the presence of a Lewis acid [lit: Chem. Pharm. Bull. 23, p.2223-2231 (1975)].

40

Compounds of formula I-2A can be prepared from compounds of formula I-2B via reduction.

45

The reaction is usually carried out at temperatures of from  $-70^{\circ}\text{C}$  to  $250^{\circ}\text{C}$ , preferably from  $-20^{\circ}\text{C}$  to  $100^{\circ}\text{C}$ , in an inert organic solvent in the presence of an acid and a reduction agent such as metal boron hydrides such as  $\text{LiBH}_4$  or diboranes, preferably  $\text{NaBH}_3\text{CN}$  [lit.: Houben-Weyl, Methoden der organischen Synthese, 4<sup>th</sup> edition, Bd. 4/1d, p. 76-78, Georg Thieme Verlag Stuttgart].

Suitable solvents are ethers, such as diethylether, diisopropylether, tert.-butylmethylether, digylme, dioxane, anisol and tetrahydrofuran, nitriles, alcohols such as methanol, ethanol, n-propanol, isopropanol, n-butanol and tert.-butanol, and also dimethyl sulfoxide, dimethyl formamide and dimethyl acetamide. Preferred solvents are methanol and tetrahydrofuran. It is also possible to use mixtures of the solvents mentioned.

Suitable acids are inorganic acids such as hydrochloric acid, hydrobromic acid and sulfuric acid, and also organic acids, such as formic acid, acetic acid, propionic acid, oxalic acid, toluene sulfonic acid, benzene sulfonic acid, campher sulfonic acid, citric acid, and trifluoroacetic acid, preferably acetic acid. In general, the acid is employed to adjust a pH of 5.

The starting materials are generally reacted with one another in equimolar amounts. In terms of yield, it may be advantageous to use an excess of compounds of  $\text{NaBH}_3\text{CN}$  based on compounds I-2B.

The reaction mixtures are worked up in a customary manner, for example by mixing with water, phase separation and, if appropriate, chromatographic purification of the crude products. In some cases, the intermediates and end products are obtained in the form of colorless or pale brown viscous oils, which are purified or freed from volatile components under reduced pressure and at moderately elevated temperature. If the intermediates and end products are obtained as solids, they can also be purified by recrystallization or digestion.

If individual compounds I are not obtainable by the route described above, they can be prepared by derivatization of other compounds I or by customary modifications of the synthesis routes described.

5

The preparation of the compounds of formula I may lead to them being obtained as isomer mixtures. If desired, these can be resolved by the methods customary for this purpose, such as crystallization or chromatography, also on optically active adsorbate, to give the pure isomers.

Agronomically acceptable salts of the compounds I can be formed in a customary manner, e.g. by reaction with an acid of the anion in question.

Dagger nematodes, *Xiphinema* species; and other plant parasitic nematode species.

The compounds I and compositions containing them are especially  
5 useful for the control of insects and nematodes.

Moreover, the compounds I and compositions containing them are especially useful for the control of pests selected from the orders Homoptera, Lepidoptera, Diptera, Thysanoptera, and Nematoda.

10

The compounds of formula (I) may be used to protect growing plants from attack or infestation by insects, arachnids or nematodes by contacting the plant with a pesticidally effective amount of compounds of formula (I).

15

The insect, arachnid, nematode, plant and/or soil or water in which the plant is growing can be contacted with the present compound(s) or composition(s) by any application method known in the art. As such, "contacting" includes both direct contact (applying  
20 the compounds/compositions directly on the insect, arachnid, nematode, and/or plant - typically to the foliage, stem or roots of the plant) and indirect contact (applying the compounds/compositions to the locus of the insect, arachnid, nematode, and/or plant).

25

Moreover, insects, arachnids or nematodes may be controlled by contacting the target parasite/pest, its food supply or its locus with a pesticidally effective amount of compounds of formula (I). As such, the application may be carried out before or after the  
30 infection of the locus, growing crops, or harvested crops by the pest.

"Locus" means a habitat, breeding ground, plant, seed, soil, area, material or environment in which a pest or parasite is grow-  
35 wing or may grow.

Exemplary plants and seeds include crop plants and their seeds or nuts, such as vines, wheat, barley, apples, tomatoes, rye, soybeans, oats, rice, maize, lawn, bananas, cotton, coffee, sugar  
40 cane, grapevines, fruit species, ornamentals, cucumbers, beans, tomatoes, potatoes and curcubits.

In general, "pesticidally effective amount" means the amount of active ingredient needed to achieve an observable effect on  
45 growth, including the effects of necrosis, death, retardation, prevention, and removal, destruction, or otherwise diminishing the occurrence and activity of the target organism. One of ordi-

nary skill in the art will recognize that the potency and, therefore, a "pesticidally effective amount" can vary for the various compounds/compositions used in the invention.

5 A pesticidally effective amount of the compositions will also vary according to the prevailing conditions such as desired pesticidal effect and duration, weather, target species, locus, mode of application, and the like. In general, for use in treating crop plants, the rate of application of the compounds and/or  
10 compositions of this invention may be in the range of about 0.1 g to about 4000 g per hectare, desirably from about 25 g to about 600 g per hectare as the active ingredient, more desirably from about 50 g to about 500 g per hectare. For use in treating seeds, the typical rate of application is of from about 1 g to about 500  
15 g per kilogram of seeds, desirably from about 2 g to about 300 g per kilogram of seeds, more desirably from about 10 g to about 200 g per kilogram of seeds. Customary application rates in the protection of materials are, for example, from about 0.001 g to about 2 kg, desirably from about 0.005 g to about 1 kg, of active  
20 compound per cubic meter of treated material.

The present compounds may be applied formulated or unformulated. Typical formulations contain the active ingredient in a range from about 0.1 ppm to about 10,000 ppm and may also contain a  
25 carrier. The carrier may be any agronomically acceptable carrier, including natural and synthetic organic and inorganic ingredients that facilitate dispersion of the composition or compound and contact with the pesticidal target. The carrier may be solid (e.g. clays, synthetic silicates, silica, resins, waxes, kaolin, bentonite, dolomite, calcium carbonate, talc, powdered magnesia,  
30 Fuller's earth, gypsum, diatomaceous earth, China clay, and combinations thereof); liquid (e.g. water, aqueous solutions, N-methylpyrrolidone, kerosene, cyclohexanone, methylethyl ketone, acetonitrile, methanol, ethanol, isopropyl alcohol, acetone, butyl cellosolved, 2-ethyl-1-hexanol, cyclohexanone, methyl cellulose, polyvinyl alcohol, sodium lignin sulfonates, polymeric alkyl naphthalene sulfonates, sodium naphthalene sulfonate, polyethylene bisnaphthalenesulfonate, sodium N-methyl-N-(long chain acid) laureates, hydrocarbons and other water-immiscible ethers,  
35 esters and ketones, and combinations thereof); or a combination of solid and liquid carriers.  
40

The active ingredients can be used as such, in the form of their formulations or the use forms prepared therefrom, e.g. in the  
45 form of directly sprayable solutions, powders, suspensions or dispersions, emulsions, oil dispersions, pastes, dusts, materials for spreading, or granules, by means of spraying, atomizing, du-

sting, scattering or pouring. The use forms depend entirely on the intended purposes. In any case, this is intended to guarantee the finest possible distribution of the active ingredients according to the invention.

5

The formulations are prepared in a known manner, e.g. by extending the active ingredient with solvents and/or carriers, if desired using emulsifiers and dispersants, it also being possible to use other organic solvents as auxiliary solvents if water is used as the diluent. Auxiliaries which are suitable are essentially: solvents such as aromatics (e.g. xylene), chlorinated aromatics (e.g. chlorobenzenes), paraffins (e.g. mineral oil fractions), alcohols (e.g. methanol, butanol), ketones (e.g. cyclohexanone), amines (e.g. ethanolamine, dimethylformamide) and water, carriers, emulsifiers and dispersants such as lignin-sulfite waste liquors and methylcellulose.

The compositions of the present invention may contain one or more surfactants to increase the biological effectiveness of the active ingredient. Suitable surface active ingredients include surfactants, emulsifying agents, and wetting agents. A wide range of surfactants is available and can be selected readily by those skilled in the art from "The Handbook of Industrial Surfactants," 2nd Edition, Gower (1997). There is no restriction on the type or chemical class of surfactant that can be used. Nonionic, anionic, cationic and amphoteric types, or combinations of more than one of these types, are all useful in particular situations.

Among nonionic surfactants, exemplary classes include polyoxyethylene alkyl, alkyne, alkynyl or alkylaryl ethers, such as polyoxyethylene primary or secondary alcohols, alkylphenols or acetylenic diols, polyoxyethylene alkyl or alkyne esters, such as ethoxylated fatty acids, sorbitan alkylesters, whether ethoxylated or not, glyceryl alkylesters, sucrose esters, and alkyl polyglycosides. Exemplary anionic surfactant classes include fatty acids, sulfates, sulfonates, and phosphate mono- and diesters of alcohols, alkylphenols, polyoxyethylene alcohols and polyoxyethylene alkylphenols, and carboxylates of polyoxyethylene alcohols and polyoxyethylene alkylphenols. These can be used in their acid form but are more typically used as salts, for example sodium, potassium or ammonium salts.

Cationic surfactants classes include polyoxyethylene tertiary alkylamines or alkenylamines, such as ethoxylated fatty amines, quaternary ammonium surfactants and polyoxyethylene alkyletheramines. Representative specific examples of such cationic surfactants include polyoxyethylene (5) cocoamine, polyoxyethylene (15)

tallowamine, distearyldimethylammonium chloride, N-dodecylpyridine chloride and polyoxypropylene (8) ethoxytrimethylammonium chloride. Many cationic quaternary ammonium surfactants of diverse structures are known in the art to be useful in combination with active ingredients and can be used in compositions contemplated herein.

Suitable emulsifying agents and wetting agents include, but are not limited to, ionic and nonionic types such as polyacrylic acid salts, lignosulphonic acid salts, phenolsulphonic or naphthalene-sulphonic acids, products of polycondensation of ethylene oxide with fatty alcohols, fatty acids or fatty amines, substituted phenols (especially alkylphenols or arylphenols), sulphonosuccinic acid ester salts, taurine derivatives (especially alkyl taurates), phosphoric esters of alcohols or products of polycondensation of ethylene oxide with phenols, esters of fatty acids with polyhydric alcohols, and derivatives having sulphate, sulphonate and phosphate groups, of the compounds above.

Substances which are suitable for the preparation of directly sprayable solutions, emulsions, pastes or oil dispersions are mineral oil fractions of medium to high boiling point, such as kerosene or diesel oil, furthermore coal tar oils and oils of vegetable or animal origin, aliphatic, cyclic and aromatic hydrocarbons, e.g. benzene, toluene, xylene, paraffin, tetrahydronaphthalene, alkylated naphthalenes or their derivatives, methanol, ethanol, propanol, butanol, chloroform, carbon tetrachloride, cyclohexanol, cyclohexanone, chlorobenzene, isophorone, strongly polar solvents, e.g. dimethylformamide, dimethyl sulfoxide, N-methylpyrrolidone and water.

Powders, materials for scattering and dusts can be prepared by mixing or concomitantly grinding the active substances with a solid carrier.

35

Granules, e.g. coated granules, impregnated granules and homogeneous granules, can be prepared by binding the active ingredients to solid carriers. Examples of solid carriers are mineral earths, such as silicas, silica gels, silicates, talc, kaolin, attaclay, limestone, lime, chalk, bole, loess, clay, dolomite, diatomaceous earth, calcium sulfate, magnesium sulfate, magnesium oxide, ground synthetic materials, fertilizers, e.g. ammonium sulfate, ammonium phosphate, ammonium nitrate, ureas, and products of vegetable origin, such as cereal meal, tree bark meal, wood meal and nutshell meal, cellulose powders and other solid carriers.

Aqueous use forms can be prepared from emulsion concentrates, pastes or wettable powders (sprayable powders, oil dispersions) by adding water. To prepare emulsions, pastes or oil dispersions, the substances as such or dissolved in an oil or solvent, can be homogenized in water by means of wetter, tackifier, dispersant or emulsifier. Alternatively, it is possible to prepare concentrates composed of active substance, wetter, tackifier, dispersant or emulsifier and, if appropriate, solvent or oil, and such concentrates are suitable for dilution with water.

10

The active ingredient concentrations in the ready-to-use products can be varied within substantial ranges. In general, they are from 0.0001 to 10%, preferably from 0.01 to 1%. The active ingredients are employed in a purity of from 90% to 100%, preferably 95% to 100% (according to NMR spectrum).

##### Example 1

##### Preparation of

7-fluoro-10-(4-ethylpiperazine)-dibenzo(b,f)thiepine

A mixture of 1.00 g 7-fluoro-10,11-dihydrodibenzo(b,f)thiepin-10-one, 3.75 g 1-ethylpiperazine and 1.17 g  $\text{TiCl}_4$  in 50 ml toluene was heated under reflux for 4 hours. After cooling to 20-25°C, the resulting suspension was filtrated, washed with water, dried with  $\text{MgSO}_4$  and concentrated in vacuo to yield 0.79 g of 7-fluoro-10-(4-ethylpiperazine)-dibenzo(b,f)thiepine.

##### Example 2

##### Preparation of

7-fluoro-10-(4-ethylpiperazine)-10,11-dihydrodibenzo(b,f)thiepine

40

0.50 g 7-Fluoro-10,11-dihydrodibenzo(b,f)thiepin-10-one was dissolved in 50 ml methanol, and 0.30 g  $\text{NaBH}_3\text{CN}$  was added. Methanol was distilled off, the residue was diluted with 10% NaOH solution and extracted 3 times with  $\text{CH}_2\text{Cl}_2$ . The collected organic layers were washed with water, dried with  $\text{MgSO}_4$  and concentrated in vacuo to yield 0.50 g of

The action of the compounds of the formula I against pests was demonstrated by the following experiments:

#### 5 Nematicidal evaluation

Test compounds were prepared and formulated into aqueous formulations using acetone. The formulations were tested using root knot nematode (2nd instar) and soybean cyst nematode (2nd instar) as 10 target species.

##### Test Procedures for root-knot nematode (*Meloidogyne incognita*):

Tomato plants (var. Bonny Best) were grown in the greenhouse in 15 plastic tubs (4 to 6 plants per tub). The plants and soil (a 50:50 mixture of sand and "New Egypt" sandy loam) were infested with *M. incognita* J2 (to establish the "in-house" colony, *M. incognita* J2 were initially acquired from Auburn University). The plants were kept pruned and were used on an "as needed" basis.

20 The tomato plants were kept in the cylinder containing hydroponic solution and aerated until the nematodes were no longer present in the solution (usually about 60 days). The cultures were checked daily by eluting a small volume (approximately 20 ml) from the bottom of a funnel attached to the cylinder into a small cry-

25 stallizing dish and observed using a binocular dissecting scope. If needed for testing, the nematodes were cleaned and concentrated by pouring the culture solution through a sieve for cleaning and a sieve for concentrating. The nematodes were then resuspended in water to a concentration of approximately 20 to 50 nematodes per 50  $\mu$ l. These were counted by putting 25  $\mu$ l of the nematode 30 solution into a well of an unused well of an assay plate. The total was then multiplied by 2 for a final total of nematodes per 50  $\mu$ l of solution. To microtiter plates containing about 1.0 mg of compound, 80:20 acetone was added to each well and the solution was mixed to obtain the desired compound concentration. The 35 nematode solution was added to each plate. The plates were then sealed and they were placed in an incubator at 27°C and 50% (+/-2%) relative humidity. After 72 hours, the population mortality was read, whereby immobility of nematodes was regarded as 40 mortality.

In this test, compounds I-1.4, I-1.5, I-1.6, I-1.7, I-1.8, I-1.9, I-1.10, I-1.17, I-1.30, I-1.31, I-1.32, I-1.34, I.1, I.2, and I.6 at 500 ppm showed over 95% mortality compared to untreated con- 45 trols.

## 113

Test Procedures for soybean cyst nematode (*Heterodera glycine*):

The soybean bean cyst nematode culture was maintained in a greenhouse and soybean eggs and J2 larvae were obtained for testing by  
5 dislodging soybean cysts from the roots with a sieve. The cysts were broken to release the eggs and the eggs were maintained in water. The eggs hatched after 5-7 days at 28°C. To microtiter plates containing about 150µg of compound, 80:20 acetone was added to each well and the solution was mixed to obtain the desired  
10 compound concentration. The nematode solution was added to the plate. The plates were then sealed and placed in an incubator at 27°C and 50% (+/-2%) relative humidity. After 72 hours, the population mortality was read, whereby immobility of nematodes was regarded as mortality.

15

In this test, compounds I-1.4, I-1.8, I-1.29, I-1.33, I.2, I.3, and I.8 at 100 ppm showed over 95% mortality compared to untreated controls.

## 20 Activity against insects and arachnids

Southern armyworm (*Spodoptera eridania*), 2nd instar larvae

The active compounds were formulated for testing the activity  
25 against insects and arachnids as a 10.000 ppm solution in a mixture of 35% acetone and water, which was diluted with water, if needed.

A Sieva lima bean leaf expanded to 7-8 cm in length is dipped in  
30 the test solution with agitation for 3 seconds and allowed to dry in a hood. The leaf is then placed in a 100 x 10 mm petri dish containing a damp filter paper on the bottom and ten 2nd instar caterpillars. At 5 days, observations are made of mortality, reduced feeding, or any interference with normal molting.

35

In this test, compounds I-1.10, I-1.12, I-1.14, I-1.15, I-1.17, I-1.25, I-1.29, I-1.30, I-1.32, I-1.33, I-1.35, I-1.38, I-1.40, I-1.41, I.1, I.2 and I.3 at 1500 ppm showed over 50% mortality in comparison with untreated controls.

40

Cotton aphid (*aphis gossypii*)

The active compounds were formulated in 50:50 acetone:water and 100 ppm Kinetic® surfactant.

45

## 114

Cotton plants at the cotyledon stage (one plant per pot) were infested by placing a heavily infested leaf from the main colony on top of each cotyledon. The aphids were allowed to transfer to the host plant overnight, and the leaf used to transfer the aphids was removed. The cotyledons were dipped in the test solution and allowed to dry. After 5 days, mortality counts were made.

In this test, compounds I-1.1, I-1.2, I-1.3, I-1.6, I-1.10, I-1.11, I-1.12, I-1.13, I-1.14, I-1.16, I-1.17, I-1.19, I-1.20, I-1.21, I-1.22, I-1.25, I-1.29, I-1.32, I-1.33, I-1.34, I-1.35, I-1.37, I-1.41, I-1.42, I.4, I.5, and I.7 at 300 ppm showed over 90% mortality in comparison with untreated controls.

Green Peach Aphid (*Myzus persicae*)

15

The active compounds were formulated in 50:50 acetone:water and 100 ppm Kinetic® surfactant.

Pepper plants in the 2<sup>nd</sup> leaf-pair stage (variety 'California Wonder') were infested with approximately 40 laboratory-reared aphids by placing infested leaf sections on top of the test plants. The leaf sections were removed after 24 hr. The leaves of the intact plants were dipped into gradient solutions of the test compound and allowed to dry. Test plants were maintained under fluorescent light (24 hour photoperiod) at about 25°C and 20-40% relative humidity. Aphid mortality on the treated plants, relative to mortality on check plants, was determined after 5 days.

Bean aphid (*aphis fabae*)

30

The active compounds were formulated in 50:50 acetone:water and 100 ppm Kinetic® surfactant.

Nasturtium plants grown in Metro mix in the 1<sup>st</sup> leaf-pair stage (variety 'Mixed Jewle') were infested with approximately 2-30 laboratory-reared aphids by placing infested cut plants on top of the test plants. The cut plants were removed after 24 hr. Each plant was dipped into the test solution to provide complete coverage of the foliage, stem, protruding seed surface and surrounding cube surface and allowed to dry in the fume hood. The treated plants were kept at about 25°C with continuous fluorescent light. Aphid mortality was determined after 3 days.

## 115

Silverleaf whitefly (*bemisia argentifolii*)

The active compounds were formulated in 50:50 acetone:water and 100 ppm Kinetic® surfactant.

5

Selected cotton plants were grown to the cotyledon state (one plant per pot). The cotyledons were dipped into the test solution to provide complete coverage of the foliage and placed in a well-ventilated area to dry. Each pot with treated seedling was placed in  
10 a plastic cup and 10 to 12 whitefly adults (approximately 3-5 day old) were introduced. The insects were collected using an aspirator and an 0.6 cm, non-toxic Tygon® tubing (R-3603) connected to a barrier pipette tip. The tip, containing the collected insects, was then gently inserted into the soil containing the treated  
15 plant, allowing insects to crawl out of the tip to reach the foliage for feeding. The cups were covered with a re-usable screened lid (150 micron mesh polyester screen PeCap from Tetko Inc). Test plants were maintained in the holding room at about 25 °C and 20-40% relative humidity for 3 days avoiding direct ex-  
20 posure to the fluorescent light (24 hour photoperiod) to prevent trapping of heat inside the cup. Mortality was assessed 3 days after treatment of the plants.

In this test, compounds I-1.1, I-1.2, I-1.6, I-1.11, I-1.12,  
25 I-1.16, I-1.25, I-1.32, I-1.33, I-1.34, I-1.35, I-1.36, I-1.37, I-1.41, I-1.42, and I.7 at 300 ppm showed over 90% mortality compared to untreated controls.

2-spotted spider mite (*tetranychus urticae*, OP-resistant strain)

30

The active compounds were formulated in 50:50 acetone:water and 100 ppm Kinetic® surfactant.

Sieva lima bean plants with primary leaves expanded to 7-12 cm  
35 were infested by placing on each a small piece from an infested leaf (with about 100 mites) taken from the main colony. This was done at about 2 hours before treatment to allow the mites to move over to the test plant to lay eggs. The piece of leaf used to transfer the mites was removed. The newly-infested plants were  
40 dipped in the test solution and allowed to dry. The test plants were kept under fluorescent light (24 hour photoperiod) at about 25 °C and 20 - 40% relative humidity. After 5 days, one leaf was removed and mortality counts were made.

45 In this test, compounds I-1.28, I-1.43, and I-1.44 at 300 ppm showed over 50% mortality compared to untreated controls.

## 116

Yellowfever mosquitos (*aedes aegypti*)

The test compound (1 Vol% in acetone) was applied to water in glass dishes containing 4th instar *aedes aegypti*. The test dishes  
5 were maintained at about 25°C and observed daily for mortality. Each test was replicated in 3 test dishes.

In this test, compound I-1.41 at 100 ppm after 6 days showed over 90% mortality compared to untreated controls.

10

Eastern subterranean termites (*Reticulitermes flavipes*)

Toxicant treatments (1.0% test compound w/w) were applied to 4.25 cm (diam.) filter papers (VWR #413, qualitative) in acetone solution. Treatment levels (% test compound) were calculated on basis  
15 of a mean weight per filter paper of 106.5 mg. Treatment solutions were adjusted to provide the quantity of toxicant (mg) required per paper in 213 ml of acetone (volume required for saturation of paper). Acetone only was applied for untreated con-  
20 trols. Treated papers were vented to evaporate the acetone, moistened with 0.25 ml water, and enclosed in 50x9 mm Petri dishes with tight-fit lids (3-mm hole in side of each dish for termite entry).

25 Termite bioassays were conducted in 100x15 mm Petri dishes with 10 g fine sand spread in a thin layer over the bottom of each dish. An additional 2.5 g sand was piled against the side of each dish. The sand was moistened with 2.8 ml water applied to the piled sand. Water was added to dishes as needed over the course of  
30 the bioassays to maintain high moisture content. Bioassays were done with one treated filter (inside enclosure) and 30 termite workers per test dish. Each treatment level was replicated in 2 test dishes. Test dishes were maintained at about 25°C and 85% humidity for 12 days and observed daily for mortality.

35

In this test, compound I-1.41 at 1% (weight per weight filter paper) after 12 days showed 100% mortality, whereas untreated controls showed 8% mortality.

40 Orchid thrips (*dichromothrips corbettii*)

*Dichromothrips corbettii* adults used for bioassay were obtained from a colony maintained continuously under laboratory conditions. For testing purposes, the test compound was diluted to a  
45 concentration of 500 ppm (wt compound: vol diluent) in a 1:1 mixture of acetone:water, plus 0.01% Kinetic® surfactant.

117

Thrips potency of each compound was evaluated by using a floral-immersion technique. Plastic petri dishes were used as test arenas. All petals of individual, intact orchid flowers were dipped into treatment solution for approximately 3 seconds and allowed to dry for 2 hours. Treated flowers were placed into individual petri dishes along with 10 - 15 adult thrips. The petri dishes were then covered with lids. All test arenas were held under continuous light and a temperature of about 28°C for duration of the assay. After 4 days, the numbers of live thrips were counted on each flower, and along inner walls of each petri dish. The level of thrips mortality was extrapolated from pre-treatment thrips numbers.

In this test, compounds I-1.10 and I-1.19 showed over 50% mortality compared to untreated controls.
